

实验十.txt
实验十：注入方法创建Bean实例

LookupMethodInjectionDemo

加入Spring2的相关的JAR包
加入asshd-lib的相关的JAR包

步骤一，创建Message类
public class Message {

```
    private String sysMessage;

    public Message() {
        sysMessage = "当前时间为： " + new
Date().toLocaleString();
    }

    public String toString() {
        return this.sysMessage;
    }
}
```

步骤二，创建抽象MessageManager类
public abstract class MessageManager {

```
    public void display() {
        Message message = createMessage();
        System.out.println(message.toString());
    }
}
```

实验十.txt

```
public abstract Message createMessage();
```

```
}
```

步骤三，创建spring配置文件

```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<beans xmlns="http://www.springframework.org/schema/beans"
```

```
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

```
xsi:schemaLocation="http://www.springframework.org/schema/beans
```

```
http://www.springframework.org/schema/beans/spring-beans-2.0.xsd">
```

```
    <bean id="Message" class="tarena.Message"
scope="prototype">
    </bean>
```

```
    <bean
        id="MessageManager"
        class="tarena.MessageManager">
        <lookup-method
            name="createMessage"
            bean="Message"
        />
    </bean>
```

```
</beans>
```

步骤四，创建测试类

```
public class Test {
```

```
    public static void main(String[] args) {
```

```
        ApplicationContext context = new
ClassPathXmlApplicationContext(
```

```
            "tarena/spring-config.xml");
```

实验十.txt

```
        MessageManager mm = (MessageManager)
context.getBean("MessageManager");

        for (int i = 1; i <= 10; i++) {
            mm.display();
            try {
                Thread.sleep(1000);
            } catch (InterruptedException e) {
                e.printStackTrace();
            }
        }
    }
}
```

步骤五，结果
时间... ..
